

ADT's based on SET

date 2/22/2023

* Comparison between Set & Linked List *

• Elements →	• elements are unique	• elements can be duplicates
• Order of elements →	• Order is NOT SIGNIFICANT (unless specified)	• order is IMPORTANT (e.g. in ArrayList)

* ADT based on Set types:

[ADT UID]

1.) ADT UID (union, intersection, difference)	2.) Dictionary	3.) Priority Queue	4.) * Set ADT operation	5.) * Implementations
			1.) set Union	a.) Array Imp. - Static / Dynamic
			2.) set Intersection	b.) Linked List - singly or doubly-linked, sorted / unsorted
			3.) set Difference	c.) Cursor-based
			4.) MAKENULL	d.) Bit-Vector Implementations
			5.) INITIALIZE	

Example:

A	B	
0 1	0 1	$U = \{0, 1, 2, \dots, 9\} \rightarrow$ Universal set
1 0	1 0	
2 0	2 0	
3 1	3 0	Set A = {3, 7, 0, 4, 9}
4 1	4 1	
5 0	5 1	Set B = {0, 4, 5}
6 0	6 0	
7 1	7 0	
8 0	8 0	
9 1	9 0	

* NOTE: List range will be the entirety of the universal set, regardless if the elements are present or not.

* BIT-VECTOR IMPLEMENTATION

date 2/22/2023

* Bit-Vector Implementation: → uses one-dimensional array.

→ also known as Boolean array implementation (T, F)

because the contents of the array is either true or false or their equivalents in the given language.

• NOTE: → Size of set is dependent on the Universal Set → all given sets are SUBSETS
→ Best used in:

> When the Universal set U is SMALL.

> Its elements are INTEGERS (or can be mapped to the set of integers)

* Example:

$$\text{Set } A = \{3, 7, 0, 4, 9\}$$

• Illustration:

A

• Observations:

0	1
1	0
2	0
3	1
4	1
5	0
6	0
7	1
8	0
9	1

→ Notice that those in the set are 1 while the rest is 0.

→ if set A is implemented using bit-vector, then

$$A[x] = 1 \text{ if } x \in A$$

$$A[x] = 0 \text{ if } x \notin A$$

• NOTE: Place a 1 for every element that is = to index in set A.

• Assign a UNIQUE integer number for each non-integer element

* ADVANTAGES *

1.) Operations Member(), insert(), & delete() can be performed in constant time = $O(1)$

2.) Operations union(), intersection(), & difference can be performed in time proportional to the cardinality (no. of elements) of the universal set = $O(N)$

3.) If the universal set U is small & can fit in one computer word = $O(1)$ operations can be performed in one logical operation

-BIT-VECTOR IMPLEMENTATION-

date 2/22/2023

* Disadvantages *

- The amount of space needed for the set is proportional to the size of the universal set, hence if the universal set is relatively big then the size of each set will also be big. = space needed = size of U

* Illustrations:

* Insert:

$$U = \{0, 1, 2, \dots, 9\}$$

$$A = \{1, 0, 5\}$$

→ Insert(A, 7)

$$A = \{1, 0, 5, 7\}$$

→ Union: $U = \{0, 1, 2, \dots, 9\}$

$$A = \{1, 0, 5, 7\}$$

$$B = \{0, 4, 5\}$$

$$\therefore \text{Union}(A, B)$$

$$A \cup B = \{0, 1, 4, 5, 7\}$$

	0	1	A	B	$A \cup B$
0	0	1	0	0	0
1	0	1	1	0	1
2	0	0	0	0	0
3	0	1	0	0	0
4	0	0	0	0	0
5	1	0	0	0	0
6	0	0	0	0	0
7	1	0	0	0	0
8	0	0	0	0	0
9	0	1	0	0	0

-- basic Set Operations --

1.) UNION() - The union of two sets A & B is the set of all elements which belong to A or B Both.

→ Notation: $A \cup B$ (read as "A union B")

Denoted by: $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$

2.) INTERSECTION() - The intersection of two sets A & B is the set of all elements are common to A and B

→ Notation: $A \cap B$ (read as "A intersection B") → Example: $A = \{1, 3, 4, 6, 9\}$

Denoted by: $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$ $B = \{2, 3, 6, 8\}$ $A \cap B = \{3, 6\}$

3.) DIFFERENCE() - The difference of two sets A & B is the set of all elements

which are in A, but not in B.

→ Example: $A = \{1, 3, 4, 6, 9\}$

→ Notation: $A - B$ (read as "A difference B")

$$B = \{2, 3, 6, 8\}$$

Denoted by: $A - B = \{x \mid x \in A \text{ and } x \notin B\}$

$$A - B = \{1, 4, 9\}$$

UID OPERATIONS VISUALIZATION

date 02/22/2023

* Union - combine all elements

$$\text{SET } A = \{7, 0, 4, 2\} \quad A \cup B = \{0, 1, 2, 4, 5, 7\}$$

$$B = \{0, 1, 5\}$$

OR $7 \ 6 \ 5 \ 4 \ 3 \ 2 \ 1 \ 0$

$$\begin{array}{r} 1 \ 0 \ 0 \ 1 \ 0 \ 1 \ 0 \ 1 \\ \oplus \\ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 1 \ 1 \end{array} = A$$

$$\begin{array}{r} 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 1 \ 1 \\ \oplus \\ 1 \ 0 \ 1 \ 1 \ 0 \ 1 \ 1 \end{array} = B$$

$$\begin{array}{r} 1 \ 0 \ 1 \ 1 \ 0 \ 1 \ 1 \ 1 \\ \underline{\oplus} \\ 1 \ 0 \ 1 \ 1 \ 0 \ 1 \ 1 \end{array} = A \cup B$$

* Intersection - find common elements

$$\text{SET } A = \{7, 0, 4, 1\} \quad A \cap B = \{0, 1\}$$

$$B = \{0, 1, 5\}$$

$7 \ 6 \ 5 \ 4 \ 3 \ 2 \ 1 \ 0$

$$\begin{array}{r} 1 \ 0 \ 0 \ 1 \ 0 \ 1 \ 1 \ 1 \\ \oplus \\ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 1 \ 1 \end{array} = A$$

$$\begin{array}{r} 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 1 \ 1 \\ \oplus \\ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 1 \ 1 \end{array} = B$$

$$\begin{array}{r} 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 1 \ 1 \\ \underline{\oplus} \\ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 1 \ 1 \end{array} = A \cap B$$

* Difference - element in A, NOT in B

$$\text{SET } A = \{7, 0, 4, 1\} \quad A - B = \{7, 4\}$$

$$B = \{0, 1, 5\}$$

* get complement of B first:

* perform AND

$$0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 1 \ 1 \rightarrow 1 \ 1 \ 0 \ 1 \ 1 \ 0 \ 0$$

COMPLEMENT

$7 \ 6 \ 5 \ 4 \ 3 \ 2 \ 1 \ 0$

$$\begin{array}{r} 1 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \\ \oplus \\ 1 \ 1 \ 0 \ 1 \ 1 \ 1 \ 0 \ 0 \end{array} = A$$

$$\begin{array}{r} 1 \ 1 \ 0 \ 1 \ 1 \ 1 \ 0 \ 0 \\ \oplus \\ 1 \ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 0 \end{array} = B$$

$$\begin{array}{r} 1 \ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 0 \\ \underline{\oplus} \\ 1 \ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 0 \end{array} = A - B$$

* Subset - if set's every element is in another set

$$\text{SET } A = \{7, 0, 4, 1\} \quad B \subseteq A$$

$$B = \{0, 1, 4\}$$

$7 \ 6 \ 5 \ 4 \ 3 \ 2 \ 1 \ 0$

$$\begin{array}{r} 1 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \\ \oplus \\ 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \end{array} = A$$

$$\begin{array}{r} 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \\ \oplus \\ 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \end{array} = B$$

$$\begin{array}{r} 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \\ \oplus \\ 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 1 \ 1 \end{array} = 0$$

✓ B is a subset of A

stratmose

SET OPERATIONS VISUALS

date 2/22/2023

* member() - returns 1/non-zero if element is a member
0 if not member

$$\text{SET } A = \{2, 4, 5\}$$

$$x = 5$$

Note: 5 is a mask value that was shifted to that position from 1

7 6 5 4 3 2 1 0

$$0011 \quad 0100 = A$$

$$0010 \quad 0000 = S$$

$$\underline{0010 \quad 0000} \neq 0 \checkmark$$

is member

$$0001 \quad 0100 = A$$

$$0010 \quad 0000 = S$$

$$\underline{0000 \quad 0000} == 0 \times$$

is NOT member

* insert() - insert element at appropriate position matching bit position.

$$\text{SET } A = \{7, 0, 4, 1\}$$

$$x = 5$$

OR 7 6 5 4 3 2 1 0

$$\textcircled{1} \quad 1001 \quad 0011 = A$$

$$0010 \quad 0000 = S$$

$$1011 \quad 0011 = \{7, 0, 4, 1, 5\}$$

* delete() - delete element at appropriate position matching bit position

$$\text{SET } A = \{7, 0, 4, 1\}$$

$$x = 5$$

* get complement of x

$$\sim 0010 \quad 0000 = 1101 \quad 111$$

* perform AND

$$1011 \quad 0011 = A$$

$$1101 \quad 1111 = S$$

$$1001 \quad 0011 = \{7, 0, 4, 1\}$$

Exercise: Union Set

date 2/22/2023

- 1.) Write an appropriate definition of datatype SET such that A is an array of integers of size 10. NOTE: SET A is a static array

• Illustration

SET A

• code:

0	
1	
2	
3	
4	
5	
6	
7	
8	
9	

#define SIZE 10

typedef int SET [SIZE];

SET A; $\rightarrow = A[10]$

- 2.) Using your definition of SET in #1, do the ff.:

- a.) function header of function Union() - the func. will return a new set

Containing element found in the given 2 sets A & B.

• Code: SET *setUnion (SET A, SET B)

\rightarrow pointer to locally declared array

- b.) Function call, declare & initialize the call:

• Assumption: U = {0, 1, 2, 3, 4} D = {0, 1, 3} //SIZE shortened to
C = {1, 3, 4} CUD = {0, 1, 3, 4} 5 for convenience

• Illustration:

• Declaration & Initialization:

C	D
0	0
1	1
2	0
3	1
4	0

SET C = {0, 1, 0, 1, 1} \rightarrow NOTE: keep declaration &

SET D = {1, 1, 0, 1, 0} \rightarrow Initialization TOGETHER

SET *retval = setUnion (C, D);

C = {1, 3, 4} D = {0, 1, 3}

NOTES:

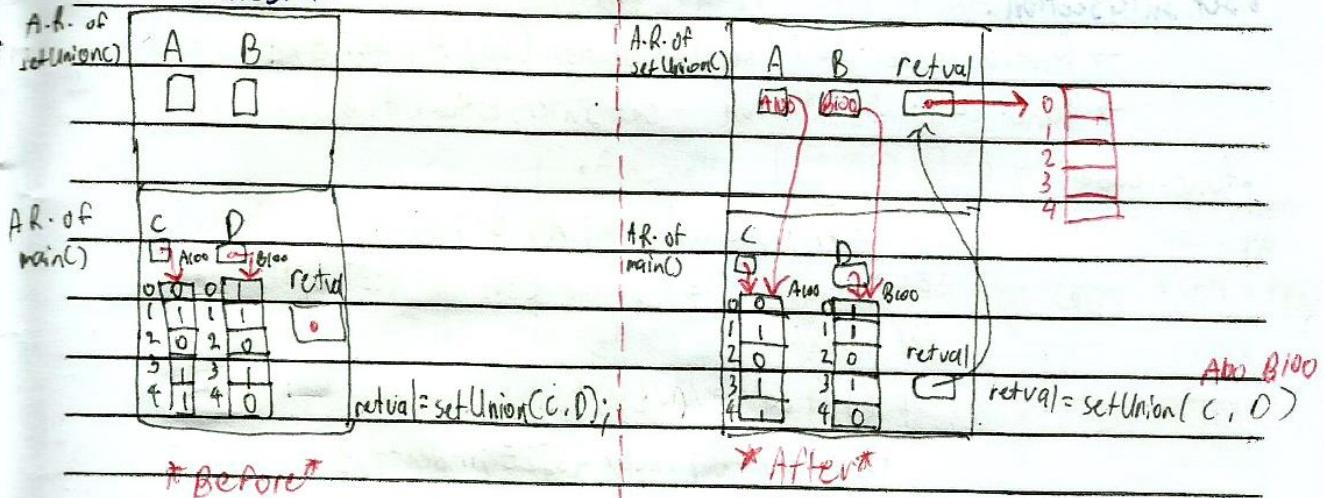

• Make a catcher variable since you're returning a new set.

• It's a pointer since it will point to the locally created dynamically allocated array in the function.

Exercise: Union Set

date 2/22/2023

* Execution stack:

* The name of an array is a **POINTER** to five components.

* A & B will get the address of `C[0]` & `D[0]` respectively.

* Array must be dynamically allocated when returned.

* Code:

```
SET *setUnion(SET A, SET B) {
    SET *retval = (SET *) malloc(SIZE, sizeof(SET));
    int index;
    initializes array to be all 0
```

```
if (retval != NULL) {
    for (index = 0; index < SIZE; index++) {
        (*retval)[index] = (A[index] == 1 || B[index] == 1) ? 1 : 0;
    }
}
```

can also be:

```
(retval)[index] =
    A[index] ||
    B[index];
    }
```

stratmore

Practice Stuff

date _____

• Set Intersection:

→ function header: $\text{SET}^* \text{setIntersection}(\text{SET } A, \text{SET } B)$

→ func. call: $\text{SET}^* \text{return} = \text{setIntersection}(A, B);$

• func. code:

```
SET^* setIntersection (SET A, SET B) {  
    SET^* return = (SET^*) malloc (sizeof (SET));  
    int index;  
    if (return != NULL) {  
        for (index = 0; index < SIZE; index++) {  
            (*return)[index] = (A[index] == 1 && B[index] == 1) ? 1 : 0;  
        }  
    }  
    return return;  
}
```

• Set Difference:

→ func. header: $\text{SET}^* \text{setDifference}(\text{SET } A, \text{SET } B)$

→ func. call: $\text{SET}^* \text{return} = \text{setDifference}(A, B);$

• func. code:

```
SET^* setDifference (SET A, SET B) {  
    SET^* return = (SET^*) malloc (sizeof (SET));  
    int index;  
    if (return != NULL) {  
        for (index = 0; index < SIZE; index++) {  
            (*return)[index] = (A[index] && !B[index]) ? 1 : 0;  
        }  
    }  
    return return;  
}
```

SET OPERATIONS: UNION (LLimpl)

date 2/22/2023

→ uses size of Set represented, Not size of Universal set

→ better if list is SORTED

Exercise 2:

Def:

```
typedef struct node {
    int data;
    struct node *link;
} nodetype, *SET;
```

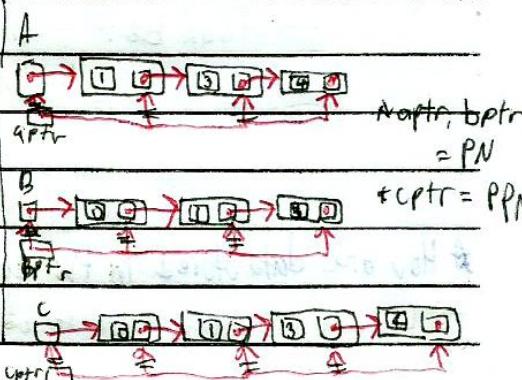

func call:

SET A;

SET B;

SET C;

C=setUnion(A,B);

code:

```
SET setUnion(SET A, SET B){
```

```
    SET C, *cptr, aptr, bptr;
```

```
    C=NULL; cptr=&C;
```

```
    aptr=A; bptr=B;
```

```
    while(aptr!=NULL & bptr!=NULL){
```

```
*cptr=(SET) malloc(sizeof(struct node));
```

```
if(aptr->data < bptr->elem){
```

```
(*cptr)->data = aptr->elem;
```

```
    aptr=aptr->next;
```

```
} else {
```

```
if(aptr->elem==bptr->elem){
```

```
    aptr=aptr->next;
```

```
}
```

```
(*cptr)->elem = bptr->elem;
```

```
bptr=bptr->next;
```

```
}
```

```
cptr=&(*cptr)->next
```

```
}
```

if (bptr != NULL) {

aptr = bptr;

}

while(aptr!=NULL){

*cptr=(SET) malloc(sizeof(struct node));

(*cptr)->data = aptr->data;

aptr=aptr->link;

cptr=&(*cptr)->link;

}

*cptr=NULL;

return C;

}

(1) Declare - aptr, bptr (PN) for traversing

- cptr (PN) for inserting

- C (new set)

(2) Loop checking until either ptr becomes NULL

(3) check if a < b, if a is smaller, insert first to C.
- update *cptr & aptr.

COMPUTER WORD IMPLEMENTATION

date 2/22/2023

* Computer Word - a unit of data of a defined bit length. | * operations:

- Can be moved & addressed | 1.) `UID`
- Can be:
 - Char - 8 bits | 2.) `member()`
 - Short int - 16 bits | 3.) `insert()`
 - int - 32 bits | 4.) `delete()`

* How are data stored in the computer Memory?

→ Characters & integers are stored in the computer's memory as a sequence of binary digits (bits).

• Example:

a.) `char ch = 'A'`

Note: A → 65

$$8 \text{ bits} \rightarrow ch = \underline{0} \underline{1} \underline{0} \underline{0} \underline{0} \underline{0} \underline{0} \underline{1} = 65$$

(ASCII Value)

since it's a character 128 64 32 16 8 4 2 1

b.) `char x = -25;` Note: do 2's complement if given is negative

= 0001 1001 → leave first 0 & 1 unchanged (none so skip)

= 1110 0110 → reverse bits

= 1110 0111 → plus 1

-25 = 1110 0111 (in computer's memory)

Note: bit patterns of positive integers start w/ 0;

• of negative integers start w/ 1

• Range value of char is -128 to 127

Recall: Bit-Vector Implementation

date 2/22/2023

$$U = \{0, 1, 2, 3, 4, 5, 6, 7\} \quad \text{SET } A = \{7, 0, 4, 2\}$$

0	1
1	0
2	1
3	0
4	1
5	0
6	0
7	1

Recall: If Set A is implemented using Bit-Vector, then

$$A[x] = 1 \text{ if } x \in A$$

$$A[x] = 0 \text{ if } x \notin A$$

Facts:

- Contents are bits (0 or 1)

- Since C does not have the "bit" datatype, char or int can be used instead.

- Elements of Universal set are indices of the array

- Can FIT INSIDE char since char = 8 bits.

* Bit-Vector to Computer Word:

Rising binary given: 7 6 5 4 3 2 1 0

$\boxed{1 \ 0 \ 0 \ 1 \ 0 \ 1 \ 0 \ 1}$ A (BV) \rightarrow Elements are index

$2^7 \ 2^6 \ 2^5 \ 2^4 \ 2^3 \ 2^2 \ 2^1 \ 2^0$

$\boxed{1 \ 0 \ 0 \ 1 \ 0 \ 1 \ 0 \ 1}$ A (Computer Word) \rightarrow Elements are Exponents

Set A is implemented using Computer word:

- if $x \in A$, then the bit position w/ place value 2^x is 1.

- ex. $4 \in A$, bit position: 2^4 is 1

- if $x \notin A$, bit position w/ place value 2^x is 0.

- ex. $5 \notin A$, bit position: 2^5 is 0.

- ComputerWord Operations (Visualization)

date 2/22/2023

• `typedef unsigned char SET;`

No negatives, ranged values 0 to 255

$2^7 \ 2^6 \ 2^5 \ 2^4 \ 2^3 \ 2^2 \ 2^1 \ 2^0$

1 1 1 1 1 1 1 1 = 255

$SET A = \{0, 1, 2, 3, 4, 5, 6, 7\}$

* How to Extract a Bit

→ can be done using bitwise operators (`& | ^ ~`)

& shifting operators (`<< >>`)

//member() - VISUALIZATION

- must EXTRACT to retrieve element (mask value)

- checks if element (exponent) is a MEMBER of set (bits)

Example: $A = \{5, 4, 2\}$

bitwise AND
 $\begin{array}{r} 10100 \\ \& 00010 \\ \hline 00010 \end{array}$

00010 → mask value

00000100 != 0 → Member

0011 0000

0000 0100 → mask value

0000 0000 == 0 → Not member

* How SHIFTING works: mask value: $0000 \ 0001 \ll 1$

* Move/SHIFT the mask value & use it to check against the elements in set A to check if elements are present.

* Mask value should always start at 1 ($0000 \ 0001$) & shift LEFT.

func. will check against each bit per iteration.

* If resulting bit pattern $\neq 0$ (means it found an element in that ^{bit} position)

$\neq 0$ (means element does not exist in that

* Ex: $0000 \ 0001 \ll 2$ bit position).

$0000 \ 0010$

\downarrow

$0000 \ 0100$

strandmore

A support page

Date 2/22/2023

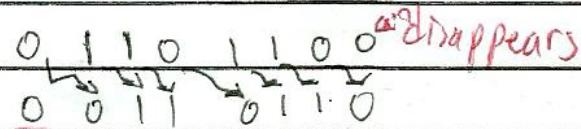

- Logical Right Shift & Arithmetic Right Shift.
- Logical Right Shift - done as `>>>` in Java
 - best done w/ unsigned data types

- Comparison between Left & Right Shift.

$$N \ll 3 = N * 2^3$$

$$N \gg 3 = N / 2^3$$

- Some Examples:

 0 1 1 0 1 1 0 0 → disappears
0 0 1 1 0 1 1 0

- 25 right shift 2

$$0\ 0\ 0\ 1\ 1\ 0\ 0\ 1 = 25$$

$$0\ 0\ 0\ 0\ 1\ 1\ 0 = 25 \gg 2$$

- -25 right shift 2

$$1\ 1\ 1\ 0\ 0\ 1\ 1\ 1 = -25$$

$$1\ 1\ 1\ 1\ 1\ 0\ 0\ 1 = -25 \gg 2$$

- Arithmetic Right Shift - Automatic 0

Exercise: Finding Bit-Pattern

Date 2/22/2023

- Write the code of the function that will accept a short integer as parameter. The function will display the bit pattern of this integer.
- use shift operators ($>>$ $<<$) and
 - use bitwise operators ($\&$ \wedge \sim)

NOTE: It should be platform independent (use `sizeof()`), do not assume any size. Use `sizeof` to compute the size of `short int` - the number of bytes,

then you can compute the no. of bits

• Code:

```
typedef short int SET;
void display Bit Pattern (SET A) {
    int index;
    int size = sizeof (short int) * 8;
    for (index = 1; index < size; index++) {
        if ((A & 1 << index) > 0) { // to print what numbers
            printf ("%d", index); } // are IN the set.
        else { printf ("0"); }
    }
}
```

• Simulation:

- Set $x = 1 \rightarrow$ Mask Value, func. will shift from here
- Calculate size of datatype - must be platform independent
- Check bit pattern of A against $1 \ll x$. (shift 1 place, 2 places)
- Print

- Comp-Word OPERATIONS CODE

date _____

* UED

- Definition: `typedef unsigned char SET;`

• Union(A,B) - returns $A \cup B$

```
SET setUnion(SET A, SET B){  
    return (A | B);  
}
```

• Intersection(A,B) - returns $A \cap B$

```
SET setIntersection(SET A, SET B){  
    return (A & B);  
}
```

• Difference(A,B) - returns $A - B$

```
SET setDifference(SET A, SET B){  
    return (A & ~B);  
}
```

• Subset(A,B) - returns 1/nonzero if $B \subseteq A$; 0 otherwise

```
int isSubset(SET A, SET B){  
    return (A & B) == B;  
}
```

* Set functions

• initialize (*A)

```
void initialize(SET *A){  
    *A = 0;  
}
```

• member (A, x)

```
int isMember(SET A, int elem){  
    return (A & 1 << elem) > 0;  
}
```

• insert (*A, x)

```
SET insert(SET *A, int elem){  
    *A = *A | 1 << elem;  
}
```

• delete (*A, x)

```
SET delete(SET *A, int elem){  
    *A = *A & ~ (1 << elem);  
}
```
